

WAMAN HARI PETHE SONS

DIGITAL ENTERPRISE PLATFORM

A Blueprint for a Unified Customer, Store Operations & Management Intelligence Ecosystem

From a 100+ year multi-showroom jewellery house to a digitally connected enterprise

Digital Transformation Proposal | Discovery Draft | August 2026

Table of Contents

1. Executive Summary

Not a website project. A digital operating system for a 100-year jewellery enterprise.

Waman Hari Pethe Sons (WHPS) has built over a century of trust since 1909, growing from a single Girgaon showroom into a twelve-location jewellery house spanning Thane, Dombivli, Ghatkopar, Kalyan, Bhandup, Pune, Ghodbunder Road, Panvel, Solapur, Chinchwad, Bhayander and Vashi. The organisation already has a digital foundation: a website with product catalogues, a store locator, gold-coin booking and enquiry/wishlist tools.

The opportunity is to unify that foundation with store operations, inventory, sales, HR, finance, franchise operations and management reporting into a single connected platform — the WHPS Digital Enterprise Platform — so that customer experience, showroom operations, franchise partners and leadership decision-making all draw on the same data.

What this document contains

- A pain-point led case for change, grounded in the current site and public customer feedback
- The full platform architecture across five layers: Customer, Business Operations, Management Intelligence, Central Data, and AI
- Every major module — commerce, CRM, inventory, operations, finance, HR/recruitment, franchise management — described at a working level of detail
- Security, compliance and BIS/HUID considerations specific to Indian jewellery retail
- A discovery plan and a clear set of next steps to validate every assumption and define priorities before development begins

Positioning note: this should be presented to WHPS as “the digital infrastructure that connects a multi-generation legacy into one intelligent ecosystem,” not as “your website has problems.”

2. Vision & Positioning

From a traditional multi-showroom jeweller to a digitally connected jewellery enterprise. Every layer of the business — customer-facing and internal — should draw on one central data platform, rather than operating as isolated tools.

2.1 The Five Platform Layers

Layer	Purpose	Representative Modules
Customer Platform	Every way a customer discovers, evaluates and buys WHPS jewellery	Website, App, WhatsApp Commerce, CRM, Loyalty, Appointments
Business Operations	Everything that keeps showrooms running	Inventory, Billing, Procurement, Repairs, Transfers, Karigar Mgmt
Management Intelligence	What leadership needs to see and decide	Executive Dashboard, Analytics, Forecasting, Alerts, Reports
Central Data Platform	One shared source of truth	Customers, Inventory, Sales, Stores, Employees, Finance, Vendors
AI / Intelligence Layer	Descriptive, predictive and prescriptive intelligence over the data	Forecasting, Root-Cause Analysis, Recommendations, Executive Copilot

2.2 Guiding Principle

Every module should be justified by a business decision it improves — not added because it is technically possible. Instead of asking “what features can we add?”, the platform is designed by asking “what decision does WHPS need to make, what information does that decision require, and how can the platform deliver that information faster and more reliably?”

Business Decision	Data Required	Intelligence Module
What should Pune stock?	Demand + inventory	Demand Forecast
Where should stock move?	Branch demand + stock levels	Transfer Recommendation
Who needs follow-up today?	CRM + engagement history	Lead Scoring
Which products aren't moving?	Sales + inventory ageing	Dead Stock Detection
Where do we need more staff?	Footfall + appointments	Workforce Forecast
Which customers may leave?	Purchase + engagement trends	Churn Intelligence
Which vendor is better?	Cost + quality + delivery	Vendor Intelligence
Why did sales fall?	Sales + footfall + inventory	Root-Cause Analysis
Is something unusual happening?	Transactions + history	Anomaly Detection
Where should WHPS franchise next?	Market data + existing coverage + applications	Franchise Expansion Intelligence

2.3 There Is Already a Digital Base

WHPS is not starting from zero. The existing site already provides a product catalogue across gold, diamond and Nath categories, a store locator, an online gold-coin booking flow, and a mobile presence for design updates. The mandate is therefore to unify, modernise, automate, integrate and intelligently operate what already exists — not replace it for its own sake.

3. Pain Points & Opportunity Areas

The items below are drawn from the current website structure and publicly visible customer feedback. They should be treated as hypotheses to validate during discovery, not as confirmed internal facts about WHPS operations.

3.1 Pain-Point Matrix

Area	Observed / Hypothesised Issue	Business Impact	Digital Solution
Website	Fragmented, catalogue-only experience	Lower conversion	Modern commerce platform
Inventory	Limited cross-store visibility	Lost sales, duplicate effort	Central inventory system
Product discovery	Limited filtering and search	Customer friction	Smart catalogue with filters
Store visit	No structured pre-visit journey	Lost leads	Appointment-driven CRM
Sales follow-up	Manual, memory-based follow-ups	Lost customers	Sales CRM with reminders
Quotations	Manual, transparency concerns	Trust issues	Digital, itemised quotation engine
Exchange / buyback	Complex, opaque deduction calculation	Customer confusion, complaints	Transparent exchange calculator
Repairs	Manual tracking	Poor visibility, missed SLAs	Repair ticketing workflow
CRM	Customer data fragmented across channels	Low retention	Customer 360° profile
Marketing	Broad, non-personalised campaigns	Low ROI	Segmentation & automation
Management reporting	Manual, store-by-store reports	Slow decisions	Executive BI dashboard
Slow-moving stock	Limited ageing visibility	Capital locked up	Inventory intelligence
Store operations	Each showroom runs in isolation	Inefficiency	Connected StoreOS
Customer service	Inconsistent by store / staff	Reputation risk	Unified service desk

3.2 What Public Feedback Signals (to validate, not assume)

Some public reviews describe dissatisfaction with exchange/buyback deductions, difficulty obtaining clear estimates, and variability in staff responsiveness or design availability by location. These are individual signals that should shape the discovery interviews in Section 14, not be treated as established conclusions about every WHPS store.

4. Platform Architecture

4.1 High-Level System Map

Customers reach WHPS through the website, mobile app and WhatsApp. All three sit behind a single API gateway that connects three core systems — CRM, E-Commerce and ERP — which in turn write to one central data platform. Business Intelligence, AI and Audit all read from that same central layer, feeding a single Management Command Center.

Tier	Components
Customer Access	Website · Mobile App · WhatsApp Commerce
API Gateway	Single integration layer for all channels
Core Systems	CRM · E-Commerce · ERP (Inventory, Procurement, Stores, Vendors)
Central Data Platform	Customers · Inventory · Sales · Stores · Employees · Finance · Vendors
Intelligence	Business Intelligence · AI · Audit
Leadership View	Management Command Center

4.2 The Complete Business Map

The platform should mirror WHPS's actual organisational structure so every module maps cleanly to a real business function:

- Corporate — Management, Finance, HR, Compliance, Security
- Branches — Store operations, Employees, Sales, Inventory, Customers, Service
- Franchise Network — Applications, Onboarding, Franchise Inventory, Performance, Compliance
- Products — Gold, Diamond, Silver, Nath, Bridal, Custom Jewellery
- Supply — Vendors, Procurement, Manufacturing, Karigars, Hallmarking, Quality
- Customers — Website, App, WhatsApp, Store, CRM, Loyalty
- Intelligence — Analytics, Forecasting, AI, Risk, Recommendations

4.3 The Jewellery Digital Passport

Every individual item should carry a unique digital identity that follows it through its entire lifecycle — from manufacture or receipt, through tagging, showcase placement, reservation, sale, and any repair or exchange:

1. Manufactured / received
2. Quality checked and tagged (barcode / QR / RFID)
3. Warehouse or vault placement
4. Branch allocation and showcase placement
5. Customer reservation
6. Sale and invoicing
7. After-sales: repair, exchange, or return

A scanned barcode, QR code or RFID tag should immediately surface the complete product record — identity, hallmark, quality checks, inventory status, movement history and sales status.

5. Module: Customer Digital Platform

5.1 Website & Commerce Journey

The online store moves beyond a static catalogue into a full purchase journey: browse → filter → compare → view detailed product → see price estimate → check store-level availability → optional virtual consultation → reserve → pay booking amount → pickup or delivery.

Filters & Discovery

- Category: Gold, Diamond, Silver, Nath, Bridal, Men's, Kids
- New arrivals, trending, budget, weight, karat, occasion, collection
- Making-charge range and real-time store availability

Real-Time Store Availability

A product page should show exactly which of the twelve showrooms currently holds that item, with direct actions to book an appointment or reserve the piece.

5.2 Mobile App & WhatsApp Commerce

A customer app covering Home, Explore, Wishlist, Orders, Appointments, Schemes, Loyalty, Repairs, Profile and an AI Assistant. WhatsApp becomes a genuine sales channel: a customer asking “Show me gold mangalsutra under ₹1 lakh” should receive relevant, in-stock options at their preferred store with direct actions to view, reserve, book an appointment, or talk to an expert — and that conversation should log as a lead in the CRM rather than staying inside a personal phone.

5.3 Customer 360° Profile & CRM

Every customer record consolidates purchase history, preferences, appointments, repairs, exchanges, schemes, loyalty status, complaints and their assigned salesperson — enabling segment-aware, personalised outreach (e.g. an anniversary reminder paired with a relevant collection) rather than blanket marketing.

5.4 Appointments

Customers select a store, date, time and purpose (bridal shopping, gold, diamond, exchange, repair, custom jewellery, investment). The booking immediately creates a lead for the assigned salesperson, who can prepare relevant products ahead of the visit.

5.5 Digital Quotations

Salespeople generate an itemised quotation — gold weight, stone weight, gold rate, making charges, wastage, stone charges, GST — delivered via WhatsApp, SMS, email or the customer app, and retained permanently in the customer's account. This directly addresses transparency concerns raised in public feedback.

5.6 Gold Rate Engine

A single, centrally updated gold-rate service feeds the website, app, quotations, point-of-sale, CRM and reports — eliminating the risk of different systems showing different rates.

5.7 Exchange / Buyback Calculator

Given the transparency concerns noted in Section 3, the exchange calculator should show its full working: gross weight, stone weight, net gold weight, purity and current gold rate feed into an estimated gold value, from which applicable deductions are shown explicitly before the exchange value and final payable amount are presented.

5.8 Loyalty & Schemes

A tiered WHPS Rewards programme (points, tier benefits such as previews, birthday offers and priority appointments) alongside digital gold-scheme tracking, where customers can see plan, monthly amount paid, remaining balance, maturity date and benefits from the app.

5.9 AI Assistant & Styling

A conversational assistant that narrows requirements by budget, style and preferred store before recommending products, plus outfit-based styling suggestions and AI-assisted visual search (a customer uploads a photo of jewellery they liked and the assistant finds visually similar WHPS products). Any AR/virtual try-on capability should be scoped as a future enhancement once the core assistant is validated.

6. Module: Product, Inventory & Vault Management

6.1 Product Master & Digital Passport

Each item is tracked at the SKU level: category, collection, design, metal, purity, gross/net weight, stone weight and type, making charges, wastage, cost, price, margin, HUID, certificate, and full media — alongside its current branch, movement history, sales history and repair history.

6.2 HUID & Hallmark Records

Because WHPS operates in India, hallmark compliance is a first-class part of the data model, not an afterthought. BIS defines the HUID as a unique six-digit alphanumeric identifier on hallmarked gold jewellery, verifiable by customers through BIS CARE, and specifies the purity and product information that must appear on invoices for hallmarked articles.

- Store HUID, BIS mark, purity/fineness, hallmarking date, article type and AHC information against every item
- Surface WHPS's own record to the customer, and link out to official BIS verification rather than presenting WHPS as the certifying authority
- Ensure invoice generation includes the article description, net precious-metal weight, purity/carat/fineness and hallmarking charges as required

6.3 Inventory Status Model

Inventory status needs more granularity than “in stock / sold”:

- Available · Reserved · In Transit · In Showcase · In Vault
- Under Repair · Under QC · Sold · Returned · Exchange · Damaged · Missing

6.4 Vault & Secure Movement

Vault structure down to branch → locker → tray → item, with a named custodian and last-verification timestamp. High-value transfers require dual authorisation (a second employee verifies the movement) and produce a full audit record of who moved what, from where, to where, of what value, and who approved it.

6.5 Showcase Management & Stock Reconciliation

Track which products sit in which physical showcase and for how long, so slow-moving items can be identified and rotated. End-of-day reconciliation compares system stock to physical stock and raises an alert on any discrepancy, with the difference, product, employee, branch and time logged for investigation.

6.6 Inventory Intelligence

- Fast-moving vs. slow-moving vs. dead stock, by store and by value
- Stock ageing bands (0–30, 31–90, 91–180, 180–365, 365+ days)
- Transfer recommendations based on comparative store demand (with human approval before execution)

7. Module: Store Operations

7.1 Inter-Store Transfer

When a customer wants a piece available at another branch, the requesting store raises a transfer request, the source store approves it, dispatch is tracked in transit, and the customer is notified automatically on arrival.

7.2 Procurement & Vendor Management

Demand forecasts feed inventory requirement calculations, which generate purchase requests, purchase orders, and goods-receipt / quality-check steps before items enter inventory. Vendor records track products supplied, purchase history, quality, pricing, delivery time and pending payments, so management can identify the strongest-performing suppliers and flag rising late-delivery risk.

7.3 Repair Management

Every repair is a tracked ticket — received, inspection, estimate, customer approval, workshop, quality check, ready, delivered — against a defined SLA, with automatic status notifications to the customer and analytics on average repair time, overdue tickets and repeat-repair categories.

7.4 Custom Jewellery & Karigar Management

Custom orders flow from requirement and design brief through estimate, approval, gold/material allocation, production, quality check, hallmarking and delivery. For in-house or partner workshops, job cards track assigned karigar, expected vs. actual weight/output and turnaround time, and a gold issue/return ledger calculates wastage variance against approved tolerances.

7.5 Quality Control

Before any item reaches sale or delivery, it passes weight, purity, stone, finish, hallmark, certificate and packaging checks with an explicit pass / fail / hold decision.

7.6 Delivery & Fulfilment

Online orders support home delivery, store pickup, ship-from-store and inter-branch fulfilment, with an order-routing recommendation that considers availability, distance, delivery time and branch workload — avoiding unnecessary movement of high-value stock.

8. Module: Sales CRM & Lead Management

8.1 Salesperson Dashboard

Each salesperson sees their day at a glance — appointments, customers handled, conversions, sales value, pending follow-ups — against a defined lead lifecycle: new lead → contacted → interested → visit scheduled → visited store → products shown → quotation → negotiation → purchased.

8.2 Lead Capture Across Channels

WhatsApp enquiries, website enquiries, and walk-ins should all create a lead record rather than living only in a phone or notebook. Leads that go unanswered beyond a defined window generate an automatic alert.

8.3 Lead Scoring & Next-Best-Action

Leads are scored on budget fit, intent and engagement so salespeople know who to prioritise; the system surfaces specific prompts (e.g. “customer viewed two similar products since receiving their quotation — follow up today”) rather than generic reminders.

8.4 Sales Copilot

Opening a customer record surfaces their budget, stated interest, purchase history, current wishlist and matching products available at that branch — reducing salesperson search time during a live conversation.

9. Module: Management Intelligence & AI

9.1 Executive Command Center

The leadership home screen should answer, at a glance: network status (branches, employees, customers, products), today's and month-to-date revenue, total inventory value, pending approvals and open issues — with a simple health indicator (green / amber / red) across sales, inventory, customer experience, staffing, repairs, procurement, finance and security that can be drilled into for detail.

9.2 Branch Digital Twin & Health Score

Every branch gets a virtual representation covering business performance, customers, people, inventory, service and operations, summarised into a single, explainable health score — with the contributing factors always visible, never a black box.

9.3 Demand & Forecasting

Demand intelligence combines sales, website searches, product views, wishlist activity, WhatsApp enquiries, appointments, footfall, season, festival calendar, location and customer segment to project demand by location, time, customer segment and price band — and to flag imbalances (e.g. one branch overstocked while another is stocked out on the same item).

Lost Demand

A dedicated view captures what customers wanted but WHPS could not provide — searches with no matching product, viewed-but-out-of-stock items, enquiries with no suitable match — quantifying the opportunity by category, location and price range.

9.4 Root-Cause Analysis

Rather than presenting a single number, the system should trace a change in performance (e.g. “why did Pune sales fall?”) through footfall, conversion, inventory availability, appointments and marketing activity, presenting evidence-backed possible drivers and confidence levels rather than a single definitive claim.

9.5 Executive AI Brief

A daily brief and a weekly review, each combining revenue movement, branch ranking, inventory risk, customer risk, staffing risk and specific recommended actions — always framed as recommendations for a human to approve, not autonomous decisions.

9.6 Human-in-the-Loop by Design

For high-value or regulated actions — inventory transfers, discounts, refunds, exchanges, hallmarking/compliance matters and employee actions — AI should recommend with stated evidence and confidence, and a named person should approve. This is a decision-support system, not an autonomous controller.

10. Module: Finance

The platform should surface revenue, gross margin, inventory value and turnover, capital locked in slow-moving stock, discounts, refunds, returns, payables and receivables directly to management — while integrating with, rather than necessarily replacing, WHPS’s existing accounting/ERP system.

- Product- and branch-level profitability, not just revenue
- Discount intelligence — flag discounting that isn’t converting to proportionally higher sales
- Refund and return pattern analysis by product, branch, employee and reason
- Online-vs-store price consistency checks, since customers value pricing consistency across channels
- Insurance tracking for high-value inventory, with expiry alerts

11. Security, Compliance & Governance

11.1 Role-Based Access

Role	Primary Access
Super Admin	Full platform configuration
Director	Organisation-wide visibility
Regional Manager	Multiple assigned branches
Store Manager	Single-branch operations
Sales	Assigned customers and products
Inventory	Stock and movement records
HR	Employee data (restricted)
Finance	Financial data (restricted)

11.2 Approval & Audit Engine

Discounts, refunds, exchanges, transfers, purchases, price changes, inventory adjustments and employee actions should route through a defined approval chain, and every sensitive change should be logged with who made it, when, from where, the before/after values, and who approved it.

11.3 Security Intelligence

Automated flags for unusual patterns — repeated failed logins, atypical login locations, permission changes, unusually large inventory adjustments, discounting outside branch norms, or repeated refunds — for human investigation, not automatic action.

11.4 Regulatory Alignment

BIS places specific responsibilities on registered jewellers around hallmarking, purity/fineness disclosure and sale documentation; the platform’s hallmark records, invoice generation and audit trail should be built to support —

not substitute for — WHPS's compliance obligations, and any customer-facing data (footfall cameras, call recordings, biometric attendance) should only be enabled with appropriate notice, consent and retention controls.

12. Module: HR & Recruitment Platform

A complete hiring-to-retirement workforce system, not a standalone careers page.

12.1 End-to-End Hiring Flow

Job opening → online application → eligibility/criteria check → AI-assisted resume screening → online quiz/assessment → score & shortlist → HR screening → role-specific interview → manager/store interview → final decision → offer → document verification → joining → employee profile → attendance / leave / performance / payroll. A candidate should become an employee record automatically on joining, without HR re-entering data already captured.

12.2 Careers Portal & Job-Specific Applications

Public job listings filterable by location, department, employment type and experience. The application form should adapt to the role — sales experience and language skills for a Sales Executive; programming languages, projects and Git history for an IT role; portfolio and design software for a Designer; college, year and availability for an internship — rather than one generic form for every job.

12.3 Eligibility Engine & AI Resume Screening

Applications are checked against defined criteria (education, experience, location, language, required skills) before HR reviews them, with any borderline case remaining visible to HR rather than being silently auto-rejected. AI-parsed resumes are mapped against the job's requirements with an explainable summary — what matches, what needs verification — rather than an opaque score.

12.4 Online Assessment Engine

Job-specific, configurable assessments (question count, duration, passing score, section weighting) drawn from a categorised question bank — sales, jewellery, gold, diamond, customer service, HR, finance, IT, communication, situational — with randomised question and option order. Any proctoring or monitoring beyond basic timing and attempt controls should be a deliberate, disclosed policy decision with proper consent and data-retention limits, not a default.

12.5 Interview Management

Structured scorecards at each stage (HR, role-specific, manager) with numeric ratings across relevant competencies and a clear recommendation, visible to later interviewers so the process builds on itself rather than repeating. Scheduling, reminders and a candidate-facing status tracker (application → eligibility → assessment → interviews → decision) keep candidates informed throughout.

12.6 Offer, Onboarding & Internal Mobility

Digital offer generation and acceptance, document verification with strict access controls, automatic employee-ID creation, and branch/role/shift assignment on joining. The same engine supports internal job postings, referrals, and an internship pipeline with practical task-based evaluation (e.g. a small coding task for IT, a campaign brief for marketing, a portfolio review for design).

12.7 Recruitment Analytics

Pipeline volume at every stage, time-to-hire, cost-per-hire, source effectiveness, assessment and interview pass rates, and offer-acceptance rate. Any correlation of hiring criteria with later employee performance should be used to improve the process with appropriate governance, and must never rank candidates on protected or sensitive characteristics.

12.8 Unified Employee Record

Recruitment, HR, attendance, performance and sales should share one employee identity, so a manager viewing an employee record can see, in one place: who they are, where they work, how they were hired, their assessment and interview history, attendance, leave, sales and targets, incentives, training, performance reviews, transfers, documents and full employment history.

13. Module: Franchise Management Platform

A complete franchise lifecycle engine — not an “Apply for Franchise” contact form.

If WHPS wants to expand beyond its directly operated showrooms, franchising should run on the same platform and the same central data model as everything else, from first enquiry through to ongoing performance monitoring.

Stage	What Happens
Opportunity & Application	Public franchise page; detailed online application covering personal, business, financial and location details
Eligibility & Evaluation	Criteria-based screening; AI-assisted location and applicant evaluation
Review & Due Diligence	WHPS review, interviews, financial/business/legal verification
Approval & Agreement	Management approval, commercial terms, legal review, digital acceptance
Onboarding & Setup	Location, interior, branding, technology, staffing, training, inventory allocation
Go-Live & Operations	Store opens; sales, inventory, service and marketing run on WHPS systems
Ongoing Monitoring	Performance, compliance, risk and renewal tracked continuously by corporate

13.1 Franchise Opportunity Page & Application

A public page explaining why WHPS is a strong franchise partner — brand legacy, jewellery expertise, multi-store experience, technology and marketing support — with a clear statement that eligibility, investment and location requirements are subject to WHPS’s actual franchise policy. The application itself goes beyond a contact form, capturing personal details, existing business background, financial profile (investment capacity, funding source, turnover), and retail/jewellery/management experience.

13.2 Location Details & Location Intelligence

Applicants submit the proposed property — address, ownership status, area, frontage, parking, floor and nearby landmarks — along with photos and a floor plan. Where permitted, public data can support a location assessment covering market potential, competition, accessibility and cannibalisation risk against existing WHPS branches, always presented as data-backed analysis to inform management judgment, not a decision made for them.

Cannibalisation Check

If a proposed location sits close to an existing WHPS showroom, the system should flag the overlap explicitly — distance to the nearest branch and an estimate of potential customer overlap — and route it for management review rather than auto-approving or auto-rejecting.

Market Gap Detection

Comparing existing branch coverage against market and demand signals can surface areas where WHPS has limited presence, feeding a ranked view of opportunity areas for the expansion team to investigate further.

13.3 Eligibility, Scoring & Document Verification

Admin-defined criteria — minimum investment, business experience, location and property requirements, financial capability, brand fit — drive an initial eligibility check, followed by an explainable applicant scorecard (financial capability, business experience, location potential, market opportunity, operational capability, documentation) with the supporting evidence always visible. Required documents (identity, business registration, financial and property documents, banking information) move through an upload → AI/OCR extraction → human legal/financial review → verified workflow; AI can extract and pre-check information, but verification decisions stay with authorised WHPS personnel.

13.4 Interviews, Due Diligence & Approval

A structured interview path — initial review, business interview, market discussion, management interview — with the same kind of scorecard used in recruitment (business understanding, financial capability, brand understanding, customer orientation, management ability, market knowledge). A dedicated due-diligence workflow tracks financial, business, location, background, legal and commercial verification as separate, statusable items. Management then sees a consolidated approval view — applicant, location, market potential, due-diligence and document status, and a recommendation — with explicit Approve / Reject / Request More Information actions.

13.5 Agreement, Onboarding & Setup

Once approved, commercial terms move through legal review to a digitally accepted agreement (with WHPS legal defining the actual terms), and the franchise record stores start date, expiry, renewal, territory and responsibilities. Onboarding is tracked as a visible checklist across location/interior, technology (POS, connectivity, CCTV integration, WHPS software), staffing and training, initial inventory allocation, and branding/signage — with an overall go-live progress indicator.

13.6 Franchise Inventory & Pricing

Every item allocated to a franchise remains traceable back to WHPS corporate — the same digital passport used across owned stores extends to franchise stock, so head office always knows what is allocated where, at what value and status. If WHPS operates a centralised pricing model, the same gold-rate engine, authorised pricing rules and discount-approval thresholds used in owned showrooms should extend to franchises, rather than giving each location unrestricted pricing freedom.

13.7 Franchise Performance & Risk Intelligence

A per-franchise dashboard (sales, target achievement, conversion, average bill, inventory) alongside network-wide franchise comparison, and an explainable health score covering sales, inventory, customer service, compliance, staffing and operations. AI-style monitoring can flag meaningful shifts — for example, sales declining while footfall stays stable — as a prompt for review rather than a final judgment, and a risk view (low / medium / high, with evidence) covers sales decline, inventory anomalies, unusual discounting, complaint trends, late payments and compliance gaps.

13.8 Training, Compliance & Support

A WHPS Academy for franchise staff — gold and diamond knowledge, WHPS products, sales, customer service, POS, security, compliance and brand standards — with tracked completion and certification/renewal status feeding into what activities staff are cleared to perform. Corporate can run digital operational audits (inventory, security, branding, service, documentation, technology) scored and photo-documented on a tablet, alongside a compliance centre for licences, brand standards, SOPs and required renewals. A dedicated franchise support desk handles technology, inventory, marketing, product, training, maintenance, commercial and HR queries against a defined SLA, and serious customer complaints escalate from the franchise to WHPS corporate when unresolved locally.

13.9 Expansion Intelligence

Franchise applications and their proposed locations become a genuine strategic input: comparing existing WHPS coverage, market size, demand signals, competition and the flow of applications (including rejected ones, handled with appropriate privacy and data governance) can help answer “where should WHPS open next?” as a data-informed question rather than a guess. This is the point where the platform moves from digitising operations to supporting expansion strategy — and it should be framed to WHPS leadership as exactly that.

13.10 Franchise Portals

Applicants track their own status — application, eligibility, documents, location review, due diligence, management review, final decision — without needing to call WHPS for updates. Approved partners get a separate Partner Portal covering sales, inventory, orders, customers, staff, training, marketing, support requests, reports, compliance, payments and documents, built on the same permission model as the rest of the platform.

Governance note: franchise scoring, location assessment and risk flags are decision-support only. Approval, agreement terms, pricing/discount authority and compliance sign-off remain WHPS management and legal decisions throughout.

14. Discovery Plan

Before any significant build work, plan structured discovery inside the business to validate every pain point above and surface anything this document has missed. This should be treated as an ongoing input to the platform, not a one-time exercise — findings here feed directly into the Next Steps in Section 15.

14.1 Management

- How do you currently manage all stores, and what reports do you receive daily?
- What information takes the longest to obtain? Where do errors happen?
- How is inventory tracked, and how are inter-store transfers handled today?
- How do you monitor salesperson performance and manage customer data?
- How are exchanges, repairs and schemes managed today?
- What software currently exists, and which systems don't talk to each other?

14.2 Store Managers

- What takes the most time every day? Where do you manually enter information?
- What customer complaints occur most frequently?
- How do you find products held at another store?

14.3 Salespeople

- How do you track leads and remember follow-ups today?
- How do you create quotations, and check product availability?
- What do customers ask most frequently that you can't answer quickly?

14.4 Customers

- How do you discover jewellery, and do you browse online before visiting a store?
- What frustrates you about the current experience?
- Would you use online reservation or appointment booking?
- What makes you choose one jeweller over another?

14.5 Franchise & Expansion (if applicable)

- Does WHPS intend to franchise, and if so, in which markets first?
- What eligibility, investment and property criteria should apply to a franchise partner?
- How much pricing, discounting and assortment freedom should a franchise have versus corporate control?
- What data can corporate see from a franchise, and what stays with the franchise partner?
- What does the current (if any) franchise or expansion process look like today?

15. Next Steps

1. Conduct the discovery interviews in Section 14 and update the pain-point matrix in Section 3 with confirmed findings from management, store managers, salespeople, customers and, if relevant, franchise stakeholders.
2. Define the central data model — customers, products, inventory, stores, employees, vendors, and franchises where applicable — and the integration points with any existing accounting/ERP and POS systems, since every module in this document depends on that shared foundation.
3. Agree the full module scope, ownership and priority order with WHPS leadership, using the pain-point matrix and the decision-driven design principle in Section 2.2 to sequence what gets built first.
4. Clarify WHPS's actual franchise intent and commercial model (Section 13) early, since it determines how much of the franchise module is needed and how it should be scoped alongside the core platform.
5. Define the team structure, delivery approach, timeline and investment required for the engagement as a whole.
6. Establish measurable KPIs up front — conversion rate, inventory turnover, average repair time, appointment-to-purchase conversion, hiring time-to-fill, and franchise health score where relevant — so the platform's impact can be tracked from day one rather than assessed only at the end.
7. Set up the governance model from Section 11 — roles, approval chains and audit logging — before any module that touches inventory, pricing, customer data or franchise operations goes live.

This document is a working blueprint for the complete WHPS Digital Enterprise Platform. Every module above should be re-validated against what discovery actually finds inside WHPS, and refined jointly with WHPS leadership, before development begins.
